

Software Development Unit 3.3

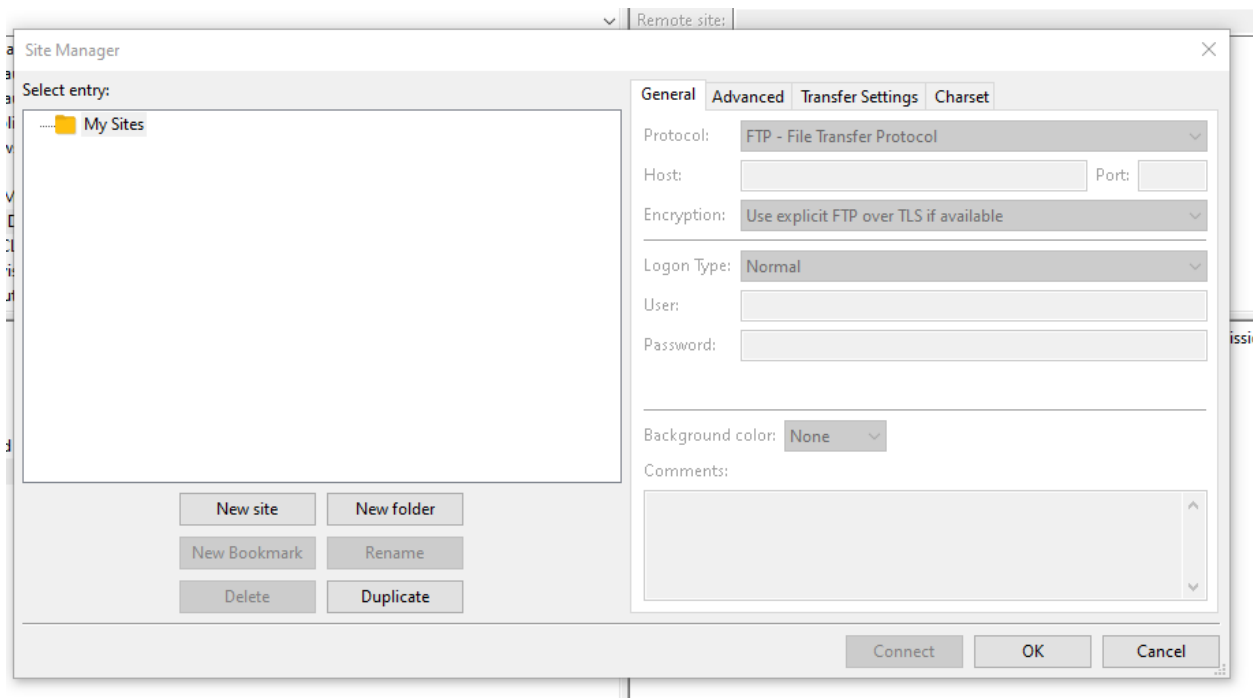

Anna Legaspi

3.3 I can select and use an appropriate programme to upload and publish the web site.

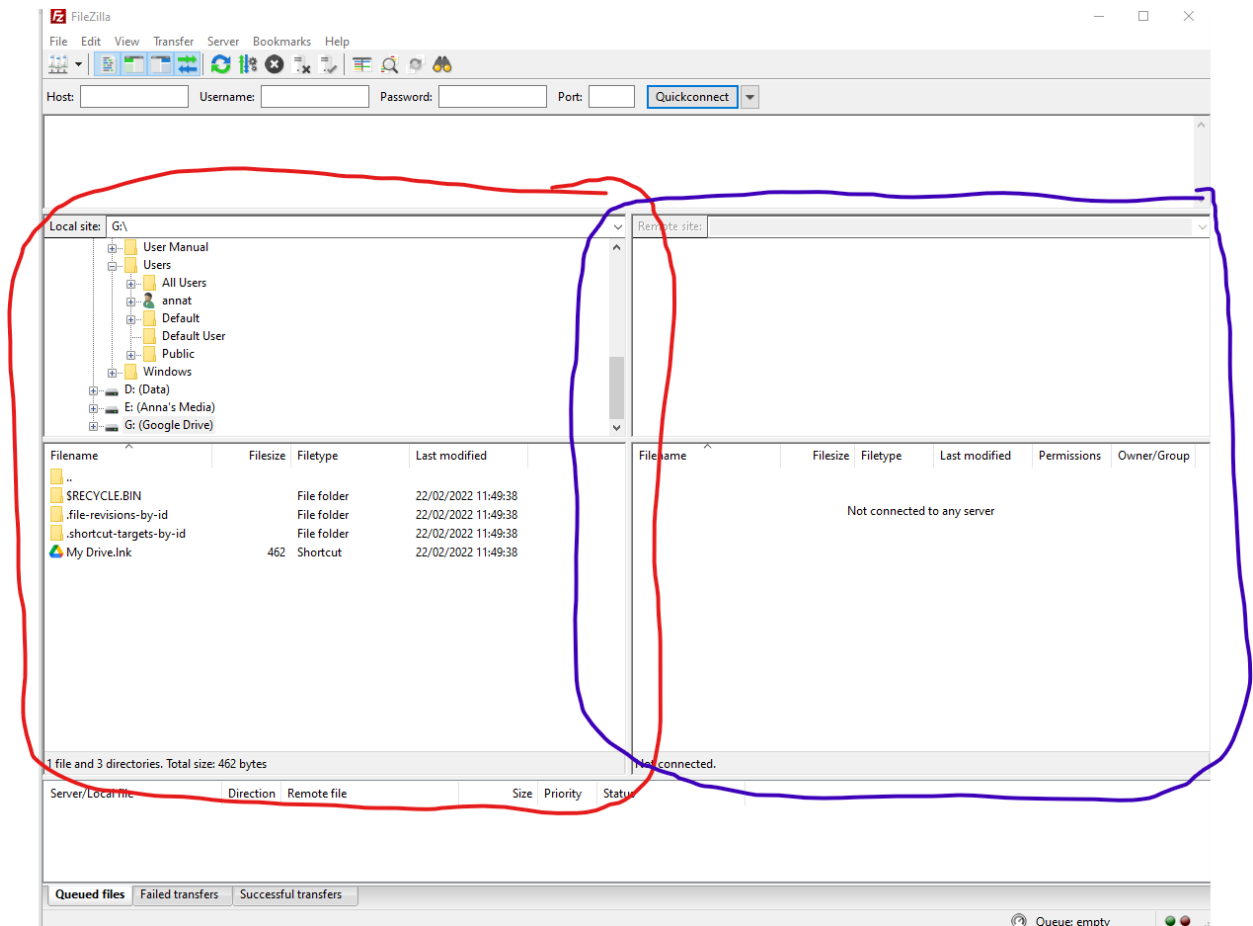

I am unable to upload and publish my website since I don't have a viable host, but I can use the software Filezilla to do this when I'm in a position to do so. However, I'm going to demonstrate how to use Filezilla for when this knowledge is needed.

Step 1 - Download and install Filezilla from <https://filezilla-project.org/>.

Step 2 - Setup the link to the website server. This can be done by going to the menu on the top left, click **File** and choose **Site manager** on the dropdown. The details needed to set this up may need to be taken from the web host. I would need details of my domain name, port and type of protocol to complete this section. Once this is done, transferring files becomes possible.

Step 3 - Transfer files to the web host.

The section circled in red or the left section displays files within my personal PC.

The section circled in blue or the right section displays files on my web host service.

To transfer the files, I would need to drag the relevant website from left to right and copy it over to the correct directory or relevant folder.
